Scissor Lift License Alberta

Scissor Lift License Alberta - The operation of scissor lifts carries an inherent chance of danger. Any type of powered machinery needs proper handling to be able to prevent accidents leading to injury or damage. Companies must ensure that staff operating this particular machine have the required training.

Unskilled staff should not be allowed by their companies to utilize scissor lifts. The lift is designed to lift materials and people to different heights. Failure to know and fully follow safety standard could lead to injuries for the users or damage to the lift.

There are no rules governing the utilization of fall protection for those who use scissor lifts. However, manufacturers can recommend the use of fall protection and in various cases tying off in scissor lifts might be required by employer guidelines, local regulations or job-specific risk assessment.

To be able to make certain that the scissor lift is in good working order prior to utilizing the machinery, the operator must perform a thorough inspection. This is the operator's responsibility, even though the unit has already been in service that same day. The operator's guidebook of the equipment contains a pre-operation checklist.

Examples of what to look for when doing a pre-operation inspection comprise checking tire-inflation pressure, and checking controls in the platform and ground controls to make certain they are functioning. When extending or retracting the boom, watch for delayed movement on the fly section which could indicate loose cables. When operating the controls, make certain that the emergency stop switches are working. Operate functions against the machine's cutout switches. Check the boom control system by cycling a boom lift to the furthest extent of its operating envelope. Safety limiters should automatically stop the unit before it moves into an unstable position, if they are functioning properly. If they aren't, shut down the lift and make certain that it is repaired before it is used again.

Safe and proper operating measures must be followed at all times. Levers should be operated with even, controlled pressure. A control lever should never be pushed from one position to the opposite position. The lever should be shifted to neutral, before stopping, and after that proceeding in the desired direction. When released, control switches and levers should return to the neutral position automatically. Depress the foot switch prior to operating platform controls.
