## **Wheel Loader Training Alberta**

Wheel Loader Training Alberta - Usually, the different kinds of heavy equipment training are classed into 2 categories of machines: those which have rubber tires and tracked vehicles. Tracked vehicles include items like cranes, bulldozers and excavators and they are usually made use of in the majority of this kind of heavy equipment training. Typically, the rubber tire training involves the rubber-tired versions of end loaders, cranes and earth movers. Heavy equipment training also includes the use of other vehicles with rubber tires like dump trucks, graders and scrapers. Training centers normally include truck driver training for the different types of heavy equipment training.

The majority of all heavy machinery operates on diesel fuel and as such, the basics of diesel mechanics are a major part of heavy equipment training. Normally, a basic course on diesel mechanics is typically required of trainees. Among the main goals of the course are to be able to teach an operator on basic troubleshooting and maintenance procedures in case of a problem with the equipment. Often, this training saves a mechanic from being called out in the middle of nowhere simply because a piece of equipment needs the addition of something minor like for instance engine oil. Diesel mechanics for heavy machines is an education all unto its own; hence, extensive training is not normally offered in the course book for the general training course.
